A first order singular problem

Equation set

$$\epsilon y' + y = x + 1, \quad y(0) = 0.$$

Solutions

Exact solution

$$y = x + (1 - \epsilon)(1 - e^{-\frac{x}{\epsilon}})$$

Inner solution

$$y_i = 1 - e^{-\frac{x}{\epsilon}}$$

Outer solution

$$y_o = x + 1$$

Matching solution

$$y_{\text{match}} = 1$$

Unified solution

$$y_{\text{unif}} = y_i + y_o - y_{\text{match}} = x + 1 - e^{-\frac{x}{\epsilon}}$$

Error

$$y - y_{\text{unif}} = -\epsilon(1 - e^{-\frac{x}{\epsilon}})$$

$$\epsilon = 0.3$$

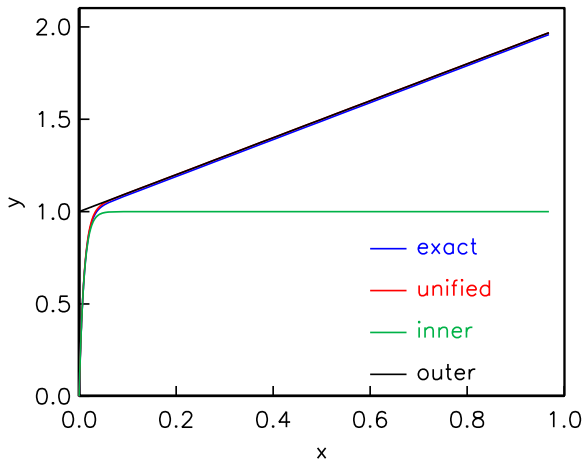

$$\epsilon = 0.1$$

$$\epsilon = 0.05$$

$$\epsilon = 0.01$$

Blow-up $\epsilon = 0.01$
